2 The Model

3 Calibration at work: the case of German Cod catches in the western Baltic Sea

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

- Different user groups have stakes in fisheries
 - larger scale commercial fishing firms etc...
 - small-scale or part-time artisanal fishermen
 - recreational fishermen

- Different user groups have stakes in fisheries
 - larger scale commercial fishing firms etc...
 - small-scale or part-time artisanal fishermen
 - recreational fishermen
- These fishing activities generate economic value in different ways. Ex: Recreational fishing requires investment in equipment and durable goods, fishing trip expenditures, supports a tourist sector.

Facts about Recreational Fisheries

• Taking world as a whole, Cooke and Cowx (2004) estimate that recreational fish harvest may amount to some 12% of the global capture fisheries harvest

Facts about Recreational Fisheries

- Taking world as a whole, Cooke and Cowx (2004) estimate that recreational fish harvest may amount to some 12% of the global capture fisheries harvest
- Regarding Europe, marine recreational fisheries gain importance:
 - In 2008, Bay of Biscay: recreational catches of sea bass ≈ same order of magnitude as those of the professional sector (Ifremer and BVA, 2009)
 - Between 2005–2010, the western Baltic Sea: annual recreational fishery cod harvests ≈ a share varying between 34 to 70% of the German commercial landings (Strehlow et al., 2012)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Facts about Recreational Fisheries

- Taking world as a whole, Cooke and Cowx (2004) estimate that recreational fish harvest may amount to some 12% of the global capture fisheries harvest
- Regarding Europe, marine recreational fisheries gain importance:
 - In 2008, Bay of Biscay: recreational catches of sea bass ≈ same order of magnitude as those of the professional sector (Ifremer and BVA, 2009)
 - Between 2005–2010, the western Baltic Sea: annual recreational fishery cod harvests ≈ a share varying between 34 to 70% of the German commercial landings (Strehlow et al., 2012)
- Management of recreational fisheries observed worldwide generally relies on a combination of regulatory measures
 - prohibition to cell caught fish
 - purchase of an angling license
 - control of fishing effort (protection of some species, bag limits, legal size, gear restrictions, protected areas or closed seasons, etc.)

Harry V. Strehlow, Norbert Schultz, Christopher Zimmermann, and Cornelius Hammer. Cod catches taken by the German recreational fishery in the western Baltic Sea, 2005–2010: implications for stock assessment and management. ICES J. Mar. Sci. (2012) 69 (10): 1796–1780

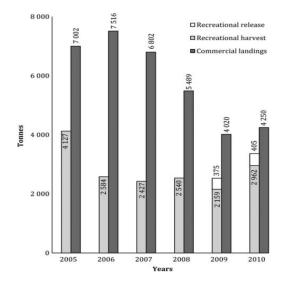

Figure: Cod harvest in t y⁻¹ in the German Baltic Sea (SD 22 + 24), and total landings in the German commercial fishery (SD 22 + 24) from 2005 to 2010, including recreational cod releases in 2009/ 2010

Facts about Small Scale Fisheries in Europe

• Large number of vessels: 84% of the vessels of the EU's fishing fleets (STECF, 2013)

◆□▶ ◆□▶ ◆三▶ ◆三▶ ◆□▶

Facts about Small Scale Fisheries in Europe

• Large number of vessels: 84% of the vessels of the EU's fishing fleets (STECF, 2013)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

• About 30% of EU landings in value and 9% in volume

Facts about Small Scale Fisheries in Europe

- Large number of vessels: 84% of the vessels of the EU's fishing fleets (STECF, 2013)
- About 30% of EU landings in value and 9% in volume
- The regulation of the Small Scale Fisheries sector is heterogenous
 - So far the CFP has not managed to provide a regulatory frame that addresses the needs of the SSF
 - There is no commonly agreed definition of SSF at European level
 - Conservation measures are decided in practically equal proportions at EU, national or regional/local levels
 → Open access situations are possible in SSF (Guyader et al., 2013)

3 Calibration at work: the case of German Cod catches in the western Baltic Sea

Objective function

Question: What is the efficient or socially optimal quota allocation of resource use rights over fishermen with different objectives, so as to

- maximize the societal benefits withdrawn from living marine resources
- prevent overexploitation of fish stocks
- improve the economic benefits derived by the various users of the fishery?

$$U(H_t, L_t) = u(H_t; \eta) + \alpha v(L_t; \beta)$$

Utility from catching a quantity H_t with fishing time (labor) L_t User groups are differentiated via parametrization: α , η , β

Production function

$$H_t = F(x_t, K_t, L_t) = q x_t^{\theta} \underbrace{L_t^{\gamma} K_t^{1-\gamma}}_{=E_t \text{ ('effort')}}$$

Cost minimization

$$\min_{L_t,K_t} \left\{ wL_t + rK_t - u(H_t,L_t) \text{ s.t. } H_t \geq F(x_t,L_t,K_t) \right\}$$

Production function

$$H_t = F(x_t, K_t, L_t) = q x_t^{\theta} \underbrace{L_t^{\gamma} K_t^{1-\gamma}}_{=E_t \text{ ('effort')}}$$

Cost minimization

ŀ

$$\min_{L_t,K_t} \left\{ wL_t + rK_t - u(H_t,L_t) \text{ s.t. } H_t \geq F(x_t,L_t,K_t) \right\}$$

From the F.O.C of the cost-minimization program

$$\frac{w - \alpha v'(L_t)}{r} = \frac{F_{L_t}(x_t, L_t, K_t)}{F_{K_t}(x_t, L_t, K_t)} = \frac{\gamma}{1 - \gamma} \frac{K_t}{L_t}$$

$$\Leftrightarrow K_t = \frac{1 - \gamma}{\gamma} \frac{w - \alpha v'(L_t)}{r} L_t$$

$$H_t = F(x_t, L_t, K_t) = q x_t^{\theta} \left(\frac{1 - \gamma}{\gamma} \frac{w - \alpha v'(L_t)}{r}\right)^{1 - \gamma} L_t$$

Sac

The demand for time at sea

Differentiating with respect to H gives

$$L^{*'}(H_t) = \frac{1}{\frac{H_t}{L_t} - \frac{(1-\gamma)^2}{\gamma r} (q \mathsf{x}_t^{\theta} L_t)^{\frac{1}{1-\gamma}} H_t^{\frac{-\gamma}{1-\gamma}} \alpha \mathsf{v}''(L_t)} > 0$$

▲□▶ ▲□▶ ▲臣▶ ▲臣▶ 臣 のへで

 $L^*(H_t)$ is increasing in H_t for $v''(L_t) \leq 0$

The demand for time at sea

Differentiating with respect to H gives

$$L^{*'}(H_t) = \frac{1}{\frac{H_t}{L_t} - \frac{(1-\gamma)^2}{\gamma r} (q \mathsf{x}_t^{\theta} L_t)^{\frac{1}{1-\gamma}} H_t^{\frac{-\gamma}{1-\gamma}} \alpha \mathsf{v}''(L_t)} > 0$$

 $L^*(H_t)$ is increasing in H_t for $v''(L_t) \leq 0$

The demand for time spent at sea admits a lower boundary

$$H \to 0 \quad \Leftrightarrow \quad L_{min} = \left(\frac{\alpha}{w}\right)^{\frac{1}{\beta}} \ge 0$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへで

The demand for time at sea

Differentiating with respect to H gives

$$L^{*'}(H_t) = \frac{1}{\frac{H_t}{L_t} - \frac{(1-\gamma)^2}{\gamma r} (q \mathsf{x}_t^{\theta} L_t)^{\frac{1}{1-\gamma}} H_t^{\frac{-\gamma}{1-\gamma}} \alpha \mathsf{v}''(L_t)} > 0$$

 $L^*(H_t)$ is increasing in H_t for $v''(L_t) \leq 0$

The demand for time spent at sea admits a lower boundary

$$H \to 0 \quad \Leftrightarrow \quad L_{min} = \left(\frac{\alpha}{w}\right)^{\frac{1}{\beta}} \ge 0$$

The second derivative of $L^*(H_t)$, with respect to H_t

$$L^{*''}(H_t) \geq 0 \quad \Leftrightarrow \quad \hat{L} \leq L_{min} \left(1 + \frac{\beta}{1-\beta}\gamma\right)^{\frac{1}{eta}}$$

- The demand for time at sea is convex in harvest for L_t below the threshold level L
- Displays constant returns to scale for $\alpha = 0$

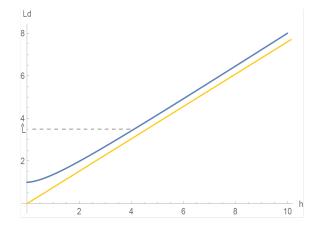

Figure: Demand for time at sea $L^*(H_t)$ for users with $\alpha > 0$ (blue) versus $\alpha = 0$ (yellow)

・ロト ・ 聞 ト ・ 注 ト ・ 注 ト

Э

Profit maximization

$$\max_{H_t} \left\{ U(H_t, L^*(H_t)) - w L^*(H_t) - r K_t^* - p H_t \right\}, \Leftrightarrow$$
$$\max_{H_t} \left\{ u(H_t) + \alpha v (L^*(H_t)) - \frac{w}{\gamma} L^*(H_t) + \frac{1 - \gamma}{\gamma} \alpha v' (L^*(H_t)) L^*(H_t) - p H_t \right\}$$

Inverse demand function for quota

$$p = u'(H_t) - \left(\frac{w - \alpha v'(L^*(H))}{\gamma} - \frac{1 - \gamma}{\gamma} \alpha v''(L^*(H)) L^*(H_t)\right) L_H^*$$

▲□▶ ▲圖▶ ▲≣▶ ▲≣▶ ̄Ξ ____のへで

Inverse demand function for quota

Appling the following specification for $v(L_t)$

$$v(L_t) = \frac{L_t^{1-\beta} - 1}{1-\beta}$$

where β conveys the scale of the recreational fishing activity as well as the satiety of this fishing group w.r.t. L_t .

The specification of p becomes

$$p = u'(H_t) - \frac{L^*(H_t)}{H_t} \frac{\left(w - \alpha L^*(H_t)^{-\beta}\right)}{\gamma},$$

◆□▶ ◆舂▶ ◆注▶ ◆注▶ 三注.

900

User groups who derive utility from time at sea have a higher demand for harvesting rights

The slope of the inverse demand function:

$$p_{H_t} = u''(H_t) - \frac{(w - \alpha L^*(H_t)^{-\beta})}{H_t^2} \frac{\beta \alpha L^*(H_t)^{1-\beta}}{w - \alpha L^*(H_t)^{-\beta}(1 - \beta(1 - \gamma))} \le 0,$$

For $u''(H_t) < 0$

The slope of the inverse demand function:

$$p_{H_t} = u''(H_t) - \frac{(w - \alpha L^*(H_t)^{-\beta})}{H_t^2} \frac{\beta \alpha L^*(H_t)^{1-\beta}}{w - \alpha L^*(H_t)^{-\beta}(1 - \beta(1 - \gamma))} \le 0,$$

For $u''(H_t) \le 0$

The derivative of p w.r.t. x_t :

$$p_{x_t} = \frac{q\theta}{\gamma x_t} L^*_{H_t} (w - \alpha (1 - \beta) L^* (H_t)^{-\beta}) \ge 0$$

The price of fishing quotas is increasing in the stock level of the targeted species.

▲□▶ ▲□▶ ▲ 臣▶ ★ 臣▶ 三臣 - のへぐ

Assuming the following specification for utility derived from harvest

$$u(H_t)=\frac{H_t^{1-\eta}-1}{1-\eta},$$

with $u'(H_t) = H_t^{-\eta} \ge 0$, and $u''(H_t) = -\eta H_t^{-\eta} \le 0$. The derivative of p w.r.t. η gives

$$P_{\eta}=u_{H_t,\eta}=-H_t^{-\eta}\ln(H_t).$$

The level of the TAC determines the willing to pay for rights to fish of a given group.

Notice that as $u(H_t)$ and $v(L_t)$ have the same specification, the parameters η and β relate to there elasticity of substitution.

The boundary of the inverse demand function for $H \rightarrow 0$

$$\lim_{H_t\to 0} p = u'(H_t) - \left(\frac{1-\gamma}{\gamma}\,\beta w\right) \, L_H^* = u'(H_t)$$

On the other hand, when $\alpha = 0$, we have

$$\lim_{H_t\to 0} p = u'(H_t) - \frac{w}{\gamma} L_H^*.$$

This difference comes from the substraction of the marginal operating cost of fishing.

Integrating different user groups into fishery management The Model

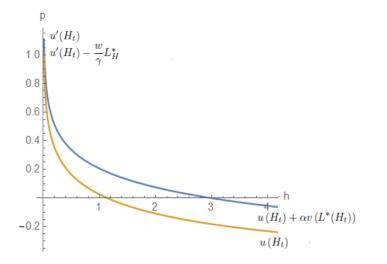

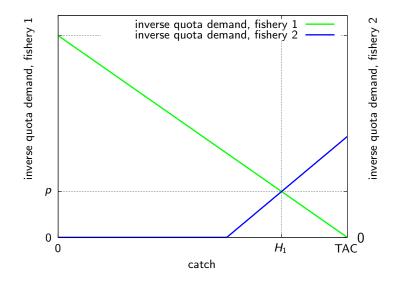

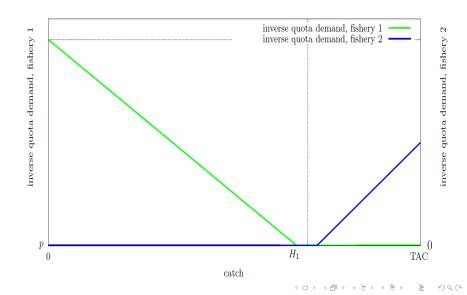

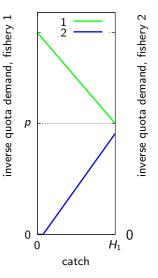

Figure: Difference in p for users with $\alpha > 0$ (blue) versus $\alpha = 0$ (yellow)
